

Getting the Most from Your Technology

Welcome to IAS

Information Age Systems.

Get the Most from Your Technology Investments

Our job is to help you manage your technology for the benefit of your organization. We employ best practices for our customers and provide clear explanations about our recommendations and strategies.

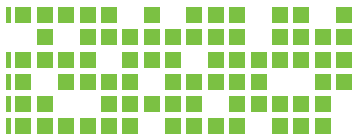

Get Started by Answering These Questions

To build a strong and efficient network, software application or complete business operations system requires understanding your users - both internal and external.

1. Who are the users and what are their requirements?
2. What applications are currently in use by these users?
3. What performance is expected from your applications?
4. Who will connect to your network and how?
5. What interoperability do you desire/need? Phone/PDA, TCP/IP, other?
6. Will the network and user base grow significantly?
7. Do you have network problems that regularly interrupt business?
8. Do you have software problems that regularly interrupt business?
9. Have you ever completed a planned technology assessment before? * If so, when?
10. What are your perceived security issues with your network?
11. What data is fundamental to your day-to-day operations?
12. Do you have levels of security access at your organization?
13. List the things you would most like your network and software to do.

Our objective is to always approach any network or software project from a business perspective. Ultimately, these items are fundamental components of your operations. Success demands understanding your users, your desires and your business objectives. IAS works in partnership with you to gain that understanding.

We provide solutions. To do that we take the time to understand the problem.
